# **LS200 Series Direct-Operated Regulators**

Figure 1. LS200 Series Direct-Operated Regulators

### Features

- Wide Pressure Range Capability with Single Regulator Up to 60 psi / 4.1 bar outlet pressure.
- Suitable for Monitoring Applications Pair the LS200 Series with pilot operated regulator in a monitor application for spring open and spring closed.
- Excellent Shock Characteristics and Fast Speed of Response – Due to two-way stabilizer vent valve, which vents the spring case more rapidly than conventional vents, lag in diaphragm and valve disk movement is minimized.
- Suitable for Hydrogen Applications Contact your local sales channel or Emerson Impact Partner for more details on Hydrogen configurations.
- **Bubble-Tight Shutoff** Single-port construction, large diaphragm area, light-rate springs along with ideal durometer disk material and seat design provide low lock-up pressures.

- Change Elastomer Disk without Disassembling the Actuator – Hex shaped stem allows for disk removal without holding the stem during maintenance. Eliminates the chance of damaging the diaphragms during maintenance.
- No Seat-to-Seat Adjustment Required Balanced single-port design eliminates necessity for seat-to-seat adjustments to achieve bubble-tight shutoff.
- Easy Access to Trim Parts Change the valve disk in 30 minutes or less. Valve seat, disk and cage easily removed with body remaining in line and without disassembly of actuator portion. Disk is accessible from bottom flange.
- **Reusable Pressure Seals** O-rings used for pressure seals, unlike gaskets, are not ordinarily damaged by disassembling the regulator.
- **Resistance to Piping Stresses** Steel constructions are available to help resist pipe stresses.

FISHER

### **Specifications**

The Specifications section lists the specifications for the LS200 Series direct-operated regulators. Factory specification is stamped on the nameplate fastened on the regulator at the factory.

### **Actuator Sizes**

**Types LS220 and LS224 (350 mm):** Medium pressure construction for outlet pressure range of 4.35 to 10 psig / 0.3 to 0.69 bar. Maximum operating inlet pressure of 125 psi / 8.61 bar. Medium Pressure for outlet range of 10 to 21.75 psi / 0.69 to 1.5 bar has a maximum operating inlet up to 285 psig / 19.7 bar. The maximum emergency inlet pressure rating is 285 psig / 19.7 bar.

**Types LS250 and LS254 (255 mm):** High pressure construction for outlet pressure range of 20 to 60 psig / 1.38 to 4.14 bar. The maximum operating inlet pressure is 285 psig / 19.7 bar with a maximum emergency inlet pressure of 285 psig / 19.7 bar.

Outlet Pressure Ranges<sup>(1)</sup> See Table 2

Pressure Ratings<sup>(1)</sup> See Table 2

- Maximum Outlet Pressure<sup>(1)</sup> See Table 3
- Wide Open Flow Coefficients See Tables 4

### Certifications

EN 334, EN 14382 and Pressure Equipment Directive (PED) DVGW Up to 25% Hydrogen Blend (Pending 100%) V9 Certifications

### **Pressure Registration**

External; downstream control line is required

### **Temperature Capabilities**<sup>(1)(2)</sup>

-20 to 150°F / -29 to 66°C Lockup and Function Tested to -40°F / -40°C

### **Control Line Connection**

Without Slam-Shut: 1/4 NPT (internal);
connection will be positioned directly over body
outlet (standard position) or 90 degrees right or left
of standard position if specified.
With Slam-Shut: 1/4 NPT (internal) connection
right or left directly over slam-shut. Can be
selected or changed after shipment.

### **Vent Connection**

3/4 NPT (internal) vent assembly

### **Approximate Weight**

Body *NPT*: 26.5 lbs / 12 kg *2x2*: 30.4 lbs / 13.5 kg *2x4*: 38.7 lbs / 17.55 kg Slam-Shut Device: 16.4 lbs / 7.45 kg Types LS220 and LS224 Actuator: 61.1 lbs / 27.7 kg (Eye nuts included) Types LS250 and LS254 Actuator: 44.9 lbs / 20.35 kg (Eye nuts included)

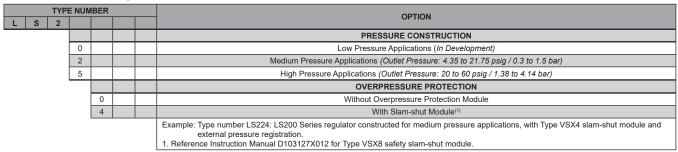

### **Construction Materials**

Body and Bonnet: Gray iron, Ductile iron and WCC Steel Cage: CF3 Stem: S17400 H1075 Orifice: 304 Stainless steel Disk: Nitrile (NBR) Inside Steel Retainer Actuator: S355ML Structural steel Elastomers: Nitrile (NBR) Diaphragm: Nylon-reinforced Nitrile (NBR)

1. The pressure/temperature limits in this Bulletin or any applicable standard limitation should not be exceeded.

2. Using optional restriction collar.

Figure 2. LS200 Series Regulator Operational Schematic

### Introduction

### Description

The LS200 Series direct-operated gas regulators are primarily designed for low pressure natural gas distribution systems, industrial and commercial applications supplying gas to furnaces, burners and other appliances. The LS200 balanced port design enables the regulator to provide accurate control of gas pressure for maximum combustion efficiency despite varying inlet pressure conditions. The single port construction provides bubble-tight shutoff. An external downstream control line is required for the operation of the regulator. Refer to Table 2 for outlet pressure ranges of each type. LS200 Series regulators are available in a 2 in. / DN 50 body size with either NPT or flanged end connections.

An optional restriction collar can be installed if wide-open capacity is too high for applications using a relief valve as overpressure protection. The collar reduces wide-open capacity to 40%, 60% or 78% of wide open capacity. 78% is sized for replacing the legacy Type 133HP 100% units without needing to resize the relief valve.

# **Principle of Operation**

In the LS200 Series, downstream pressure is registered under the diaphragm via the external control line and is used as the operating medium. Increased demand lowers the downstream pressure and allows the spring to move the diaphragm and stem assembly down, opening the valve disk and supplying more gas to the downstream system. Decreased demand increases the downstream pressure and moves the diaphragm and stem assembly up, closing the valve disk and decreasing the gas supply to the downstream system.

# **Boosting System**

The LS200 Series incorporates a balancing diaphragm and a boosting system. When the regulator is locked up, inlet pressure is registered on the top of the disk and on the bottom of the balancing diaphragm through space between the stem and cage. Also, downstream pressure is registered on the bottom of the disk and on the top of the balancing diaphragm through a passage in the stem. When the trim is open, gas flows from the inlet over the edge of the disk to the outlet. Under the disk, there is little gas flow. The gas pressure is higher than it is in the flow path where gas velocity tends to lower the pressure. The higher pressure near the disk is registered on the top of the balancing diaphragm through the space between the stem and the cage.

This pressure registered on the top of the balancing diaphragm aids downward disk travel and compensates for spring and diaphragm effect. This improves regulator rangeability and performance

# Installation

The regulator may be installed with actuator above or below the body but is normally installed with the actuator portion above the body portion. Flow through the body must be in the direction indicated by the flow direction arrow cast on the body portion. A downstream control line is required for operation of the regulator.

A remote vent line may be required for some installations. Vent openings must be protected against the entrance of rain, snow, insects or any other foreign material that may plug the vent.

External dimensions are shown in Figure 3.

# Integrated Slam-shut

The LS200 Series is offered with an integral slam-shut device that will stop gas from flowing if an over pressure or under pressure condition occurs.

The slam-shut design is industry leading with only design allowing choice of which side of the body to install the slam-shut.

The slam-shut measuring element utilizes the VSX8 Series actuator (see VSX8 Series literature for more details and support). The VSX8 Series uses a positive latching mechanism instead of a ball bearing design. The Positive Latch Mechanism reduces false trips related to vibration or external factors. See Figure 3 for more information.

# **Overpressure Protection**

As is the case with most regulators, the LS200 Series regulators have outlet pressure ratings that are lower than the inlet pressure ratings. Some type of Overpressure Protection is needed if the actual inlet pressure ever exceeds the outlet pressure rating.

Maximum inlet and outlet pressures for the LS200 are given in Table 3. All models must be protected against inlet pressure above the maximum emergency inlet pressure. (Refer to Table 3.)

# Capacity Data

Flow capacities for various inlet pressures and outlet pressure settings are shown in Tables 7 and 8. Capacities are in thousands of Nm<sup>3</sup>/hr and SCFH at 60°F and 14.7 psia and in thousands of Nm<sup>3</sup>/h at 0°C and 1.01325 bar of 0.6 specific gravity gas. To convert to equivalent capacities of other gases, multiply the SCFH values shown by the appropriate factor: air - 0.775; propane - 0.628; butane - 0.548; nitrogen - 0.789. For gases of other specific gravities, multiply the given capacity by 0.775, and divide by the square root of the appropriate specific gravity. Then, if capacity is desired in Nm<sup>3</sup>/h at 0°C and 1.01325 bar, multiply SCFH by 0.0268.

### Note

For optimum performance, select the lowest spring range that includes the desired outlet pressure setting. Capacity Data gathered using 4 in. / DN 100 outlet piping.

For restricted-capacity constructions, determine flow capacities for outlet pressure settings of 2 psig / 0.14 bar or less by multiplying the values from Tables 7 and 8 by 40%, 60% or 78% (depending upon which restriction collar is selected). If flow capacities for inlet pressures lower than those shown are required, contact your local Sales Office.

The representative regulating C<sub>a</sub> of 2000 may be used for regulator sizing of full capacity constructions only if capacity table data is not available. The representative regulating  $C_{d}$  is an approximation only for pressure drops greater than 5 psi / 0.34 bar, because, at a given offset in controlled pressure, the regulating C<sub>a</sub> varies with the spring being used with the pressure drop across the valve. To determine capacity using the flow coefficient  $C_{a}$ , use the appropriate procedure below.

### **Critical Pressure Drops**

For critical pressure drops (absolute outlet pressure equal to or less than one-half of absolute inlet pressure), use the following formula:

$$Q = (P_1)(C_q)(1.29)$$

# **Non-Critical Pressure Drops**

For pressure drops lower than critical (absolute outlet pressure greater than one-half of absolute inlet pressure).

$$Q = \sqrt{\frac{520}{GT}} C_g P_1 SIN \quad \left(\frac{3417}{C_1} \sqrt{\frac{\Delta P}{P_1}}\right) DEG$$

where,

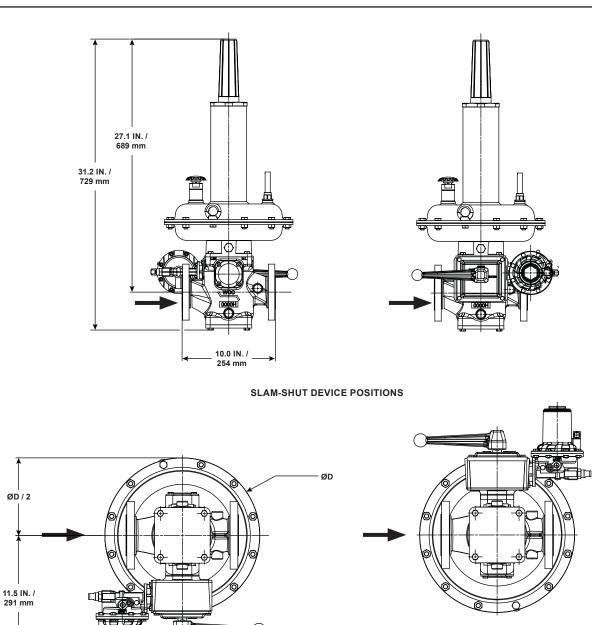

- Q = gas flow rate, SCFH
- P<sub>1</sub> = absolute inlet pressure, psia ( $P_1$  gauge + 14.7)
  - = regulating or wide-open gas sizing coefficient
- C<sup>'</sup>g G = specific gravity of the gas
- Т absolute temperature of gas at inlet, "Rankine
- $C_1$ = flow coefficient
- $\Delta \mathbf{P}$ = pressure drop across the regulator, psi

# **Ordering Information**

Use the Specifications section on page 2 and carefully review the description to the right of each specification. Use this information to complete the Ordering Guide on the following page. Specify the desired selection wherever there is a choice to be made. Then send the Ordering Guide to your local Sales Office.

### **Ordering Guide**

Actuator (Select One)

- □ Type LS220
- □ Type LS250

### Body Material and End Connection Style (Select One)

### **Ductile Iron**

- □ PN16
- □ CL150 RF
- □ PN16 with expanded outlet
- □ CL150 RF with expanded outlet

### Steel

- □ NPT
- □ PN16
- □ CL150 RF
- □ PN16 with expanded outlet
- $\hfill\square$  CL150 RF with expanded outlet

### Outlet Pressure Range (Select One)

#### Type LS220

- $\hfill\square\,$  4.35 to 5.1 psig / 0.30 to 0.35 bar, Light Green
- □ 4.35 to 10.6 psig / 0.3 to 0.73 bar, Pink
- □ 4.8 to 15.7 psig / 0.33 to 1.08 bar, Dark Blue
- □ 8.3 to 21.75 psig / 0.57 to 1.5 bar, Orange

### Type LS250

- □ 20 to 30.3 psig / 1.38 to 2.09 bar, Pink
- 20 to 44.8 psig / 1.38 to 3.09 bar, Dark Blue
- □ 25 to 60 psig / 1.72 to 4.14 bar, Orange

### Trim, Percent of Full Capacity (Select One)

- □ 100% (standard)
- □ 78%
- □ 60%
- □ 40%

### Elastomers

□ Nitrile (NBR) (standard)

### Slam-Shut Position (refer to Figure 3) (Select One)

- 🗆 L-R
- 🗆 R-L
- $\hfill\square$  L-R with Field Conversion Option
- R-L with Field Conversion Option
